INTRODUCTION

The mission of the National Council of State Boards of Nursing (NCSBN®) is to provide leadership to advance regulatory excellence by assisting member boards, collectively and individually, and to promote safe and effective nursing practice in the interest of protecting public health and welfare.

NCSBN serves as a consultant, liaison, advocate and researcher to its members, and as an educational and informational resource to policy makers and the general public. This publication provides statistics on the licensing activities of NCSBN's member boards and its two licensure examinations, the National Council Licensure Examination for Practical Nurses (NCLEX-PN®) and the National Council Licensure Examination for Registered Nurses (NCLEX-RN®).

Part I. License Statistics

The data reported in Part I of this document include licensing statistics of the 60 state and territorial boards of nursing. The numbers of new licenses by endorsement and examination, as well as the total number of active licenses are provided for each jurisdiction.

The data included in this publication provide licensing statistics for the period July 1, 2007, to

®

P

The data reported in this section indicate licensure processing activity and the total number of individuals licensed to practice within each jurisdiction from July 1, 2007, to June 30, 2008. All data was obtained from state and territorial boards of nursing.

Estimates were provided where the exact figure requested for this collection of data was unknown.

Data are presented in a series of tables. Table 1 lists the NCSBN member boards, the geographic locality within which a board of nursing (BON) has responsibility for regulating nursing practice (JD), the types of licenses for which a BON has licensing authority, and whether or not the BON is empowered to issue licenses or certificates to practice in a specialty area of nursing. Tables 2 through 5 provide data related to new licenses issued by endorsement or examination, total numbers of active licenses (both registered nurse [RN] and licensed practical/vocational nurse [LPN/VN]) by jurisdiction and graduates of foreign nursing programs licensed by jurisdiction. Table 6 provides a summary of licensing activities by examination and endorsement for RNs, LPN/VNs and graduates of foreign nursing programs. Tables 7 and 8 provide the numbers of active specialty licenses issued within each jurisdiction by specialty license category. Figure 1 provides a review of the numbers of active licenses for the years 1998 to 2008. Unless noted otherwise, all percentages are calculated in terms of column totals.

Key Terms

Registered Nurse (RN) and Licensed Practical/Vocational Nurse (LPN/VN) obtain licensure by endorsement (if licensed in another jurisdiction) or by examination (if the applicant has never taken the appropriate NCLEX examination).

Active License figures are based on the reported actual or estimated total number of individuals holding an active license within a jurisdiction and represent the nurses available for employment. Due to an unknown number of individuals holding active licenses in more than one jurisdiction, the total number of active licenses nationwide may be higher than the total number of nurses.

Advanced Practice Registered Nurse (APRN) Groups: certified registered nurse anesthetist (CRNA); certified nurse midwife (CNM); certified nurse specialist (CNS); CNS-PSYCH/mental health; and nurse practitioner (NP).

Introduction

In 1982, NCSBN revised the State Board Test Pool Examination (SBTPE) substantially. NCSBN changed the examination from a norm-referenced test to a criterion-referenced test, implemented a new test plan, and used Rasch's (1960) one parameter logistic model to calibrate items and measure candidates' abilities. At this time, NCSBN renamed the examinations the National Council Licensure Examination for Registered Nurses (NCLEX-RN®) and the National Council Licensure Examination for Practical Nurses (NCLEX-PN®). However, these NCLEX® examinations were very different than the NCLEX

3. The results from the annual Standard Setting Survey, which solicits the opinions of employers and educators regarding the competence of the current cohort of entry-level nurses.
4. Information detailing the educational readiness of high school graduates who expressed an interest in nursing.

In April 1998, the passing standard for the NCLEX-RN examination increased from -0.42 logits to -0.35 logits. In April 2001, this standard was retained for another three years. In April 2004, the standard increased to -0.28 logits. In April 2007, the standard was again increased to -0.21 logits. The passing standard for the NCLEX-PN examination has experienced a similar increase over time. In April 1999, the passing standard for the NCLEX-PN examination increased from -0.51 logits to -0.47 logits. In April 2002, this standard was retained for another three years. In April 2005, the NCLEX-PN passing standard increased from -0.47 to -0.42 logits. Finally, in April 2008, the standard increased to -0.37 logits. It is important to note that the registered nurse (RN) and practical nurse (PN) standards are not directly comparable because they are based on different item pools and different scopes of practice.

Pass-Fail Decision

Candidate performance on the NCLEX examinations is reported only as a pass-fail decision. Scores are never reported. As a result, almost all the statistics presented here are pass rates or statistics based upon a pass-fail decision.

To make pass-fail decisions, the computer seeks to determine with 95% certainty whether the candidate's true ability is above or below the passing standard. To do this, three pieces of information must be known: the person's ability estimate, the precision of that estimate and the passing standard. After the minimum number of items has been answered, the computer compares the candidate's ability level to the standard required for passing. Candidates clearly above the passing standard pass. Candidates clearly below the passing standard fail.

If the candidate's ability level is close enough to the passing standard that it is not clear which side of

the passing standard his/her ability falls, the computer continues asking items. As more items are answered, the candidate's ability estimate becomes more precise. After each item, the candidate's ability level is recomputed, using all of the information (answers to all the items asked) available at that point. When it becomes clear on which side of the passing standard the candidate's ability falls, the exam ends.

Some candidates' abilities, of course, are very close to the passing standard. For these candidates, all items in the item pool might not provide enough information to be certain their ability is truly above or below the passing standard. These are the candidates who take the maximum number of items. Once the maximum number of items has been administered, the computer waives the 95% certainty requirement and makes a pass or fail decision based upon the candidate's final ability estimate. If the candidate's ability estimate is above the passing standard, **3**

If an NCLEX examination ends because time runs out, then the computer does not have enough information for candidates to pass. The key word here is consistently. If a candidate's ability estimate has been consistently above the passing standard over the last 60 items, then he/she will pass, despite having run out of time.

Table 2.5 a S a c F -T e, U.S.-Ed ca ed Ca d da e	
NCLEX-RN	January-December 2008
Passing Standard ¹	-0.21 logits
Estimated Decision Consistency ²	0.91
Average Test Length ³	121 items
Percent of Candidates Taking the Minimum Number of Items	51.0%
Percent of Candidates Taking the Maximum Number of Items	14.1%
Average Testing Time ⁴	2 hours, 32 minutes
Percent of Candidates Taking the Maximum Amount of Time	2.2%

¹The NCLEX-RN passing standard scale uses logits as the unit of measurement. Logits is short for log-odds-units. These units have no inherent meaning with regard to nursing content and in fact have an arbitrary zero point, but logits are practical because the probability of a correct response can easily be computed when the candidate's ability and the item's difficulty are known. Typically, the logit range on the NCLEX-RN scale is from -2.00 (easy items or low ability candidates) to 2.00 (difficult items or high ability candidates).

²Estimated Decision Consistency is an indicator of reliability. Conceptually, it is the proportion of pass-fail decisions that would remain the same if the same population were retested immediately after their first test (assuming no learning or fatigue effects using a different set of items).

³NCLEX-RN examinations consist of 75 to 265 items.

⁴The standard amount of allotted testing time for the NCLEX-RN examination is six hours.

Table 3.F - Testing, U.S.-Educated Candidates

A large rectangular area of the page is redacted with horizontal grey bars. The redaction covers the majority of the page's content, obscuring any text or data that might have been present in a table or list format.
